#### **DETAILED ACTION**

Page 2

#### Election/Restrictions

- 1. Restriction to one of the following inventions is required under 35 U.S.C. 121:
- I. Claims 1-19, drawn to an apparatus and method for encoding realtime and non-realtime contents, classified in class 725, subclass 91.
  - II. Claim 20, drawn to a terminal for receiving and demodulating a modulated signals, classified in class 725, subclass 100.
- 2. Inventions I and II are related as combination and subcombination.

  Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because the terminal for receiving and decoding a modulated signals feature of group II can be used in other system such as set top box.
- 3. Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.

Application/Control Number: 09/458,796 Page 3

Art Unit: 2611

4. Because these inventions are distinct for the reasons given above and have acquired a separate status in the art because of their recognized divergent subject matter, restriction for examination purposes as indicated is proper.

5. During a telephone conversation with attorney Steve Hertzberg (Reg. 41834) on 1/16/2003 a provisional election was made with traverse to prosecute the invention of group I, claims 1-19. Affirmation of this election must be made by applicant in replying to this Office action. Claim 20 is withdrawn from further consideration by the examiner, 37 CFR 1.142(b), as being drawn to a non-elected invention.

### Specification

6. The disclosure is objected to because of the following informalities: US patent application, line 7 of page 8, is missing. Appropriate correction is required.

## Claim Rejections - 35 USC § 103

- 7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 8. Claims 1-9,11-12, 14-16 and 19 are rejected under 35 U.S.C. 103(a) as

Page 4

Art Unit: 2611

being unpatentable over Naimpally (US 5,619,337), and in view of Yanagihara (US 5,859,949).

Regarding claim 1, Naimpally discloses encoder 112 comprises video encoder 140, audio encoder 142, data encoder 144 for encoding video, audio and data in PES packets, the PES packets are supplied to a transport encoder/multiplexer 146, the multiplexer 146 formats each of the PES packets into one or more transport packets, these packets are transmitted to FIFO buffer 150, the transport packets then sent to multiplexer 116, the multiplexer 116 reformats and interleaves the transport packets for the individual single program transport streams into a multi-program transport streams (see figures 1A, 1B and, col. 3, lines 50-61; col. 5, lines 30-49). Inherently, the apparatus comprises non-realtime content source (data content source) configured to provide non-realtime content; a non-realtime encoder (encoder 144) coupled to the nonrealtime content source and configured to encode the non-realtime content into encoded non-realtime content; a realtime content source configured to provide realtime content; a realtime encoder (encoders 140, 142) coupled to the realtime content; multiplexer 116 reads on the remultiplexer. In addition, Naimpally discloses providing timing signal containing timing information for each of respective one of the transport packets in the stream and means for encoding the time information (see col. 10, lines 60-65). However, Naimpally does not specifically disclose a re-timestamp unit coupled to the remultiplexer and configured to provide timestamps to be applied to the transport packets in order to synchronize the realtime and non-realtime contents.

Yanagihara teaches a re-timestamp unit 12 coupled to the remultiplexer 10, Multiplexer 10 supplies the multiplexed signal at a bit rate of 30 Mbps to the PCR restamping circuit 12. PLL circuit 5 supplies the output of circuit 8, identified herein as data PCR', also, to PCR restamping circuit 12 which replaces in the multiplexed signal the PCR data with the PCR' data (see figure 5 and col. 7, lines 58-67). Inherently, retimestamps unit is configured to provide timestamps to be applied to the transport packets in order to synchronize the realtime and non-realtime contents. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Naimpally to incorporate the feature as taught by Yanagihara in order to synchronize the realtime and non-realtime contents.

Regarding claim 2, Naimpally in view of Yanagihara teaches an apparatus as discussed in the rejection of claim 1. Inherently, the apparatus is located within a head end of a cable distribution system in order to provide transport packets to multiple receivers, thereby increase efficiency for the system.

Regarding claim 3, Yanagihara teaches 27 MHz system clock (see figures 2 and 5) that read on the clock unit.

Regarding claim 4, Naimpally discloses the fullness of buffer 150 is monitored by buffer control circuitry 148. If the number of transport packets in the buffer 150 exceeds

Art Unit: 2611

a high water mark, the buffer control circuitry 148 sends a signals to encoders 140, 142, 144 to decrease either the rate at which PES packets are provided or size of each PES packet. If the number of transport packets in the buffer 150 falls below a low water mark, the controller 148 sends a signal to the encoders 140, 142, 144 which causes the controller to increase the rate at which PES packets are provide or to increase the size of a PEC packet (see col. 5, lines 49-62). It is obvious that the rate control unit (controller 148) configured to determine an encoding rate for the non-realtime content and to provide the determined encoding rate for the non-realtime content to the non-realtime encoder in order to avoid underflow and overflow.

Regarding claim 5, the rate at which PES packets are provided is determined based on the fullness of buffer 150 as discussed in the rejection of claim 4. It is obvious that the encoding rate for the non-realtime content is determined based at least in part on an output rate of the transport stream in order to prevent underflow and overflow

Regarding claim 6, the controller 148 determines the rate which PES packets are provided based on the fullness of buffer 150 as discussed in the rejection of claim 4. It is obvious that the rate control unit determines an encoding rate for the realtime content based on at least in part on an output rate of the transport in order to avoid underflow and overflow.

Page 6

Page 7

Regarding claim 7, Naimpally teaches the realtime content includes video and audio contents (see figure 1B).

Regarding claim 8, Naimpally teaches the data includes PAT, PMT and CAT (see col. 6, lines 35+). Therefore, Naimpally teaches the non-realtime content includes guide data.

Regarding claim 9, Naimpally teaches the realtime encoder includes a video encoder configured to encode the realtime video content; and an audio encoder configured to encode the realtime audio content (see figures 1A, 1B).

Regarding claim 11, Yanagihara teaches the timestamps provided by the retimestamp unit replace timestamps generated by the realtime and non-realtime encoders (see figure 5).

Regarding claim 12, Naimpally teaches transport encoder/multiplexer 146 reads on the slice combiner (see figures 1A, 1B).

Regarding claim 14, the limitations of the method correspond to the limitations of the apparatus as being claimed in claim 1 and are analyzed as discussed in the rejection of claim 1.

7170011101 **110**1111001: 007400,70

Regarding claim 15, the limitations of the method correspond to the limitations of the apparatus as being claimed in claim 3 and are analyzed as discussed in the rejection of claim 3.

Page 8

Regarding claim 16, the limitations of the method correspond to the limitations of the apparatus as being claimed in claim 5 and are analyzed as discussed in the rejection of claim 5.

Regarding claim 19, the limitations of the method correspond to the limitations of the apparatus as being claimed in claim 12 and are analyzed as discussed in the rejection of claim 12.

9. Claims 10, 17 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Naimpally (US 5,619,337) in view of Yanagihara (US 5,859,949) and further in view of Adams (US 6,044,396).

Regarding claim 10, Naimpally in view of Yanagihara teaches an apparatus as discussed in the rejection of claim 5. However, neither Naimpally nor Yanagihara specifically discloses the encoding rate for the non-realtime content is determined based on a maximum bit rate anticipated for the encoded realtime content.

Adams discloses the selector 404 selects data from the video buffers 400 until all video buffers 400 are empty; the selector 404 passes data form the application buffer 402 to the output buffer 406. The selector 404 continues reading from the application buffer 402 until data is detected in one or more of the video buffers 400 (see col. 4, line 65-col. 5, line 7; col. 7, lines 6-27). Inherently, the encoding rate for the non-realtime content is determined based on a maximum bit rate anticipated for the encoded realtime content. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Naimpally and Yanagihara to incorporate the feature as taught by Adams in order to provide realtime content to receiver on time thereby increase data transmission efficiency.

Regarding claim 17, the limitations of the method being claimed correspond to the limitations of the system being claimed in claim 10 and are analyzed as discussed in the rejection of claim 10.

Regarding claim 18, Naimpally in view of Yanagihara teaches an apparatus as discussed in the rejection of claim 14. However, neither Naimpally nor Yanagihara specifically discloses the allocating the bit rate for the encoded non-realtime content among a plurality of pages of non-realtime content.

Adams teaches allocating the bit rate for the encoded non-realtime content (see figure 10 and col. 7, lines 6-49). Therefore, it would have been obvious to one of

Art Unit: 2611

ordinary skill in the art at the time the invention was made to modify Naimpally and Yanagihara to incorporate the feature as taught by Adams in order to prevent underflow and overflow.

Page 10

10. Claim 13 is rejected under 35 U.S.C. 103(a) as being unpatentable over Naimpally (US 5,619,337), in view of Yanagihara (US 5,859,949) and further in view of Alexander (US 6,177,931).

Regarding claim 13, Naimpally in view of Yanagihara teaches an apparatus as discussed in the rejection of claim 1. However, neither Naimpally nor Yanagihara specifically discloses realtime and non-realtime contents intended to be displayed in a single frame are re-timestamped by the re-timestamp unit such that the contents are decoded and presented in the same frame.

Advertisement window 1 and advertisement window 2 for displaying advertisements and grid portion for displaying program information (see figure 1). Inherently, realtime and non-realtime contents intended to be displayed in a single frame are re-timestamped by the re-timestamp unit such that the contents are decoded and presented in the same frame. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Naimpally and Yanagihara to incorporate the

Art Unit: 2611

feature as taught by Alexander in order to allow viewer to view advertisements, video and program information at the same time in the same screen.

### Conclusion

11. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Kawamura et al. (US 2001/0005447) teaches data multiplexer, data multiplexing method, data recording medium, data recorder, data demultiplexer and data demultiplexing method.

Haskell et al. (US 5,543,853) teaches encoder/decoder buffer control for variable bit rate channel.

Takahashi (US 6,359,910) teaches clock conversion apparatus and method.

Lyons et al. (US 6,061,399) teaches method and apparatus for information stream frame synchronization.

Lenihan et al. (US 6,169,843) teaches recording and playback of audio-video transport stream.

Art Unit: 2611

Nuber et al. (US 5,598,415) teaches transmission of high rate isochronous data in

MPEG 2 data streams

Terasawa et al. (US 6,147,714) teaches control apparatus and control method for

displaying electronic program guide.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Son P Huynh whose telephone number is 703-305-

1889. The examiner can normally be reached on 8:00-5:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Andrew Faile can be reached on 703-305-4380. The fax phone numbers

for the organization where this application or proceeding is assigned are 703-872-9314

for regular communications and 703-872-9314 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or

proceeding should be directed to the customer service office whose telephone number

is 703-306-0377.
